#### **ABSTRACT**

A study determined computer research and exemplary project needs in home economics education, identified such projects, and analyzed the relationship of research and exemplary project needs to projects identified. The questionnaire instructed respondents to describe their perceptions of research needs and exemplary project needs related to computers in home economics education and to identify and describe computer-related research and exemplary projects completed, underway, or planned in home economics education. The 381 responses (out of a possible 809) included 218 questionnaires and 163 follow-up postcards. Of the 218 respondents, 77% were teacher educators, 15% state supervisors, and 8% "other." The most frequently cited perceived research needs related to the concepts of computers and learning and instructional software. The most frequently perceived exemplary project needs were computers and learning and instructional software. Analysis of research projects described indicated that action research studies were the most common, that the most common research subjects were inservice home economics teachers, and that most projects were comprehensive in content covered. Analysis of exemplary projects described showed that most provided inservice for teachers and dealt with software or courseware applications at the secondary level. In general, the directions of research projects identified were consistent with needs identified by professionals. The exemplary projects described appeared to be progressing toward stated needs for such programs. Appendixes include summary tables and the survey instrument. The attached supplements to this report consist of two lists of respondent names (including institutions and addresses) and two sets of outline descriptions for the research and exemplary projects respectively. (YLB)

#### **ACKNOWLEDGMENTS**

Projects are rarely completed by university faculty working alone in ivy covered towers. Many people and organizations have helped bring this project to reality.

The respective institutions assisted in many ways to support the project both directly and indirectly. Specifically, faculty research grant money was provided by the University of North Dakota (UND) Office Of Research and Program Development. Financial support was also provided in part from the Iowa State University (ISU) Department of Home Economics Education, the ISU Home Economics Research Institute, and the University of Texas-Austin Department of Home Economics.

Special appreciation is extended toward personnel assisting in clerical aspects of the project. These include: UND Department of Home Economics and Nutrition secretary Sandy Walen, and work study students Karen Blewer, Rhonda Eide, Lisa Fuchs, Julie Napper, Terry Thibaudeau, and Lori Voeller.

Margaret Tweten, UND graduate student in Vocational Education, assisted in the processing and preliminary analysis of the data.

The original activity and groundwork for the project were developed through the American Vocational Association. Home Economics Division Research Committee. This committee functions to facilitate and communicate research in vocational home economics education. Much of the committee's work is done through various subcommittees, each of which focuses on specific research needs in the field. This project was conducted by a subcommittee composed of the authors. Although research needs in this area would have likely been conceptualized by many professionals within the field, the fact that a research committee of this nature exists has meant that greater directed effort could occur within this area. The initial impetus provided by the Research Committee is appreciated.

Finally, special thanks are extended to Bertha G. King in the U.S. Department of Education. Her foresight and assistance within this area were invaluable.

#### Home Economics Education

#### Computer Research and Exemplary Projects:

#### State of the Art

#### INTRODUCTION

What are research and exemplary project needs related to computers in home economics education? What research and exemplary projects are being conducted? With the rapid increases in computer use in home economics education and their projected future applications, these are questions asked by many professionals in the field.

As a result, the American Vocational Association Home Economics Division Research Committee formed a subcommittee on computers in home economics education. The first task of this group was to assess the state of the alt of home economics education computer research and exemplary projects. The major purpose of this exploratory study was to identify what is being done and what needs to be done in order to provide a basis for greater directed effort within the field.

The objectives of this study were:

- (1) to determine computer research and exemplary project needs in home economics education.
- (2) to identify computer research and exemplary projects completed, underway, and planned in home economics education.
- (3) to analyze the relationship between research and exemplary project needs to projects identified.

A research project was defined as any project which included a research component as identified by the respondent. An example would be an inservice needs assessment. An exemplary project was defined as any project which did not include a stated research component, but was significant beyond the local community. Examples of exemplary projects would include software development or an inservice education model.

This report begins with a description of the project method as related to the instrument and sample. Separate sections are included on respondent perceived needs, and research and exemplary projects conducted. Each section includes a separate discussion of the data analysis procedures and the findings. A separate section is included comparing research and exemplary project needs with actual projects reported. Finally, conclusions and recommendations are provided.

#### METHOD

#### Instrument

A questionnaire was developed focusing on the major objectives. First, respondents were instructed to use an open-ended format to describe their perceptions of research needs and exemplary project needs related to computers in home economics education. Second, they were asked to describe computer related research and exemplary projects completed, underway, or planned in home economics education. For each of the projects listed, respondents were requested to provide a description of the project, including: contact person and position, project purpose, research subjects (or audience) addressed, content area addressed, and products.

#### Sample

Questionnaires were sent in February, 1984, to the 640 teacher educators identified in the 1983 National Directory of Vocational Home Economics Teacher Educators and the 179 state supervisors identified through the U.S. Department of Education. One month after questionnaire distribution, follow-up postcards were sent to non-respondents. Postcards allowed respondents to check: if they had no information to contribute at the time of the survey, or if another staff member actively involved in the area had completed the questionnaire. Of the 819 surveys in the initial mailing, 10 surveys were returned indicating that the person was no longer at that address. This reduced the total possible respondents to 809.

Of the 809 possible respondents, 381 (47%) responses were received. Respondents represented 48 states, 2 territories, and the District of Columbia. Teacher educators represented 45 states and 190 (67%) of the 285 colleges and universities surveyed. States supervisors represented 37 states, two territories, and the District of Columbia. It was concluded that because the respondents represented a broad geographical distribution, sufficient sample was present for assessing the state of the art.

The 381 responses included 218 questionnaires and 163 follow-up postcards. Of the follow-up postcards, 131 respondents indicated that they had no information to contribute and 32 indicated that another staff member actively involved in this area had completed the survey. It was concluded from this response that, at the time of the survey, many teacher educators and state supervisors lacked sufficient background and involvement to respond to the survey. Indeed, the comment was frequently made: "I haven't had enough background to answer the questionnaire."

The 218 respondents to the questionnaire included 167 (77%) teacher educators, 33 (15%) state supervisors, and 18 (8%) "other" (Table 1). The "other" category primarily referred to titles

Table 1

State Supervisor	33	15
Other	18	8
TOTAL	218	100

other than teacher educator and state supervisor; this included state consultants and department chairpersons of teacher education programs.

#### RESPONDENT PERCEPTIONS OF NEEDS

#### Procedure for Analysis

The first area of the questionnaire, respondent perception of research and exemplary project needs, was subjected to a content analysis. The content categories identified for both research and exemplary project needs were parallel relating to five major concepts: computer literacy of teachers, computers and learning, instructional software, instructional management, and computers in the home (Figure 1). Across these five concepts, 21 subconcepts were identified. Because of the low number of responses to instructional management, no subconcepts were identified. Responses to each item were coded according to the concept and subconcept addressed. In addition, responses were coded accordingly if respondents did not respond, or indicated limited or no knowledge to respond.

Responses from teacher educators, state supervisors, and others were combined for reporting. Frequencies were calculated; data were reported separately for research and exemplary project needs from the most to least frequently cited concepts. Within concepts, data were reported from most to least frequently reported subconcepts. It should be noted that since the questions were open-ended, reported frequencies did not necessarily represent all those respondents who may have felt that a concept (or subconcept) represented a need. Respondent comments were included in the discussion to further describe perceived needs.

#### Findings and Discussion

#### Research Needs

For research needs, 190 (87%) respondents answered the question; 12 (6%) did not respond to the question; and 16 (7%) indicated limited or no knowledge to respond. In total, respondents listed 351 responses as research needs (Table 2).

The greatest number of responses related to the concept of computers and learning (n=154 responses, or 43% of the responses). Within this concept, respondents identified eight subconcepts. The need most frequently cited was for research comparing the effectiveness of instructional methods (n=48). One respondent described this as establishing whether computers do a better job than existing methods and why. The second most frequently cited subconcept was an assessment of the current use of computers at the secondary level (n=39). An analysis of use across home economics content areas and within FHA/HERO was included in this area.

Respondents also indicated a need for guidelines to integrate computers into curriculum (n=20). An area of respondent concern was in determining the role of computers in the home economics

n = Number of responses to a subconcept.
t = Total number or responses to a concept area.

classroom, including the "fit" and "non-fit" with varying conceptions of curriculum. A consistent theme in responses was an emphasis in home economics curriculum on "high tech" as well as "high touch" aspects.

An analysis of learning theories and computer use was another area of respondent concern (n=18). One respondent described this research need as the theoretical foundation for curriculum change in home economics education. Other research needs within this concept area related to use with special groups (n=14), availability of computers (n=7), needs assessment (n=5), and current use at the postsecondary level (n=3).

The second most frequently cited concept related to instructional software (n=104, or 30% of the responses). Responses in this area included four subconcepts. Within this concept, guidelines for development received the most responses (n=43). Many respondents who cited this as a research need also commented on the lack of quality software.

Current availability of software was identified as a research need (n=27). Respondents consistently identified dietary analysis and personal finance as areas where a number of software programs were available.

Respondents also cited software evaluation as a research need (n=21). In addition, software needs assessment was identified as a research need (n=13). Specific needs by home economics content areas were also described; these needs included simulations in parenting and family relations, and housing related programs using graphics. Others cited the need for an integrated curriculum; this would include texts, workbooks, software, and other supplementary materials related to units of instruction.

Research needs related to <u>computers in the home</u> was the third most frequently cited concept (n=46, or 13 of the responses). Within this concept, five subconcepts were identified. The most frequently cited need in this area related to the impact/effect of computers on individuals and families (n=25). Other research needs in this area included current hardware and software uses (n=9), needs assessment (n=6), cost benefit of computer use (n=4), and user characteristics (n=2).

Computer literacy of teachers was the fourth most frequently cited concept (n=37, or 11% of the responses). Included in this area were four subconcepts: inservice education (n=13), current skills and attitudes (n=9), competencies needed (n=9), and preservice education (n=6). Respondents consistently identified the need for a fective methods to move undergraduates, graduates, teacher educators, and state supervisors into the computer mainstream.

Instructional management was the fifth most frequently cited concept (n=10, or 3% of the responses). Research needs within this area included a comparison of the time effectiveness of instructional management software and conventional clerical methods. Other needs included the effect of increased feedback on student learning and an analysis of the amount of time actually available to cover concepts.

#### Exemplary Project Needs

For exemplary project needs, 156 (72%) respondents suggested needs; 49 (22%) did not respond to the item; and 13 (6%) indicated limited or no knowledge to respond. In total, 196 exemplary project needs were identified (Table 3). Fewer respondents completed this question and as a result, fewer total exemplary project needs were identified. In general, exemplary project needs paralleled the order and type which were listed as research needs.

Computers and learning was the most frequently cited concept (n=72, or 37% of the responses). The need for curriculum integration guidelines was the subconcept most often reported (n=20); respondents had specific suggestions relating to what this should include and how this should be done. Specifically, respondents identified the need for a curriculum using computers in secondary consumer and homemaking education classes; this would include teaching about home computer use. The need for the identification of the model classroom with the computer integrated into the curriculum was also cited. Respondents also suggested the need for exemplary projects showing how teachers have successfully integrated the computer into the curriculum.

Other needs which related to computers and learning included: comparison of the effectiveness of instructional methods (n=14), current use at the secondary level (n=12), relationship of learning theories to computer use (n=7), needs assessment (n=6), availability of computers (n=6), use with special groups (n=4), and current use at the postsecondary level (n=3).

Instructional software was the second most frequently cited concept (n=67, or 34% of the responses). The area cited most often was the need for software development guidelines (n=36). Needs suggested by respondents primarily centered on quality assurances. For example, some respondents described the need for software field testing prior to availability; others suggested the need for a home economics education software clearinghouse.

The remaining three subconcepts were identified by respondents as follows: current availability (n=16), software evaluation (n=9), and needs assessment (n=6). Respondents had specific suggestions for software program needs; these included: home economics programs using a game format (not simulations); programs to promote mental, social, and emotional development of children;

exercise programs, energy conservation programs; and family budget programs. Respondents also identified the need for increased availability of software through the development of user networks, and the sharing of non-copyrighted software at professional meetings.

Computer literacy of teachers was the third most frequently cited concept (n=26, or 13% of the responses). Areas of need included: inservice education (n=8), preservice education (n=7), competencies needed (n=6), and current skills and attitudes (n=5). A consistent need identified was for teacher educators to provide leadership within this area. One respondent commented on the need to address how to work the computer into an already crowded teacher education curriculum. Others commented on the need to spend time in inservice and preservice education on both experiencing computer technology and exploring its meaning in our lives.

Computers in the home was the fourth most frequently cited concept (n=18, or 9% of total). Exemplary project needs related to: user characteristics (n=10), impact/effect of computers on individuals and families (n=4), needs assessment (n=3), and current hardware/software uses (n=1).

<u>Instructional management</u> accounted for 10 responses (5% of total responses). Examples related to actual teacher use in managing classes or the department.

#### RESEARCH AND EXEMPLARY PROJECTS

#### Procedure for Analysis

Research and exemplary projects described by respondents were analyzed separately. For each, projects were content analyzed according to five areas: contact person's professional position, project purpose, research subjects (or audience) addressed, content area addressed, and products. Classifications for each of these areas were determined based on responses to the questionnaire checklist section and an analysis of respondent project descriptions.

For both research and exemplary projects, frequencies and percentages were reported for the classifications within each area. Classifications were presented and discussed from those most to least often reported within the areas.

Two cautions must be considered in analyzing the data and generalizing the results. First, research and exemplary projects reported were described by project contact persons or home economics educators who had some knowledge of the project. Since, in some cases, information about the research or exemplary project was provided by someone other than the project contact person, the completeness or accuracy of the information provided could vary.

Second, because of the interrelatedness of home economics education with other content specialties, several respondents included project descriptions which were from a broader home economics or vocational aducation context. While most projects appeared to have some relationship to home economics education, in a few instances, the relationship was less clear.

All project descriptive data were included in the findings and discussion. In areas where the information was incomplete, the information was classified as "not specified".

Summary tables of research and exemplary projects reported are included in Appendix A and Appendix B respectively. For each project, information was listed as to state of origin, purpose of the project, research subjects (or audience) addressed, content area addressed, and products. A separate document identifying the contact person and address for each project is available upon request from the authors. This also was sent to each of the 50 state supervisors.

#### Findings and Discussion

#### Research Projects

A total of 38 research projects were described by 28 professionals. Of the contact persons listed, seven contact

## Table 4 Research Projects:

Positions of Contact Persons

Position Title	n
University faculty member	19

n = Number of research studies with contact person in the position described.

persons were involved in two or more projects. Of the 38 studies,  $18 \ (47\$)$  were in progress,  $14 \ (39\$)$  were completed, and  $6 \ (16\$)$  were planned.

The contact persons represented five categories of professional positions (Table 4). University faculty members were reported most often as contact persons (n=19, or 61%); secondary level home economics teachers were the next greatest number represented (n=5, or 16%). Other professional groups included state education specialists, graduate students, and an extension specialist.

Project descriptions provided by respondents indicated that the research conducted represented seven research purposes (Table 5). Action research studies were the most common (n=15, or 39%) projects. These studies primarily included workshops and courses designed to teach computer literacy or computer applications, and generally were accompanied by data collection on attitude, knowledge, or skill development gains resulting from instruction. Software evaluation, which was the focus of seven studies (18%), was the second most common type of study. Five additional studies (18%) were classified as descriptive; these studies used attitude questionnaires, a Q-sort, interviews, and observations to provide information about research subjects. Needs assessments and surveys were the primary research objectives of four studies (10%). Software development was the purpose of four studies (10%).

Туре	n	
Action	15	
Evaluation	7	
Descriptive	5	
Needs assessment/survey	4	
Software development	4	
Media effectiveness	2	
Literature review	1	

n = Number of research projects addressing each purpose.

Two studies (5%) were categorized as "media effectiveness" research. In each, the computer was used as an instructional medium to teach home economics subject matter; pretests and posttests were used to examine changes in knowledge, skills, and/or attitudes. Respondent descriptions of media effectiveness research projects indicated that comparative data on the effectiveness of other media in teaching the same subject matter were not collected. Thus, the studies were classified as media effectiveness studies rather than redia comparison studies.

Thirty-seven research projects focused on subjects in nine areas; the description of the remaining project did not specify research subjects (Table 6). The most common research subjects were inservice home economics teachers. Sixteen research studies (44% of the projects reported) focused on secondary level home economics teachers' needs, skills, attitudes, knowledge, or competencies. These studies included both homemaking teachers and occupational home economics teachers.

The evaluation of computer software was the focus of nine studies (25%). Preservice home economics teachers or undergraduate students were research subjects in four studies (11%). Typical

audiences of home economics instruction (secondary students, rural homemakers, families, and preschool children) were the subjects in four studies (11%). The remaining two research projects focused on extension educators and on computer related literature.

Content areas addressed by each research project generally included several areas within home economics (Table 7). If three or more home economics content areas were identified, it was assumed that the content spanned the comprehensive consumer and homemaking education program. Most projects (n=24, cr 68%) were identified as comprehensive in content covered. When a single content area was addressed, the area most frequently identified was child development and family relationships (n=4, 11%).

Research products ranged from data collected through

various research instruments to the development of computer software programs, curriculum materials, and workshops or graduate courses. The wide distribution of products indicated that investigators had a variety of research objectives which were not tied exclusively to producing empirical generalizations through experimental research methodology.

The most common products of research were inservice or preservice workshops and courses (n=14, or 37%), gain scores on attitude, skills, or knowledge tests (n=10, or 26% of the research projects), software programs (n=9, or 24%), software evaluation (n=8, or 21%), and needs assessments or surveys (n=6, or 16%) (Table 8). Five studies (13%) produced data collected in descriptive research. The remaining studies produced theses or dissertations, written curriculum, a competency exam, and a literature review/conceptual paper.

#### Exemplary Projects

Forty-two exemplary projects were identifed by 38 respondents. Of these projects, 15 (36%) were completed; 21 (50%) were in

progress; and 2 (5%) were planned. In the 34 projects where professional titles for project directors were indicated, 24 were university faculty, seven were high school home economics teachers, and six were state, regional or city supervisors (Table 9).

Half of the projects (n=22) indicated multiple purposes, while the remaining half (n=20) listed a single purpose (Table 10). The project purposes from those most to least frequently reported were software evaluation, curriculum development, impact of technology on the family, software development, needs assessment, computer literacy, and network development.

Most projects (60%) provided inservice for teachers and dealt with software or courseware applications at the secondary level (62%) (Table 11). The next most common audience was preservice education (33%). Postsecondary and adult education each were the

focus of 21% of the projects.

Content addressed by each project generally included several areas within home economics. Comprehensive consumer and homemaking education accounted for 24 (57%) projects, while occupational home economics education was addressed in 11 projects (26%) (Table 12).

When a single content area was addressed by a project, the areas most frequently addressed were food and nutrition (n=10, or 23%), child development and family relations (n=7, or 17%), and home management and family economics (n=4, or 10%). The content areas least frequently addressed were housing, home furnishings, and equipment (n=2, or 5%), and textiles and clothing (n=1, or 2%).

Five projects were identified as "not home economics related". These included other areas which were identified as utilities for instructional management, office management, and programming applications in preschool and mathematics class settings.

Although only 13 projects indicated software development as a major purpose, 17 projects indicated that some software or

Not home economics related	5	

n = Number of exemplary projects addressing content described. Multiple responses were permitted.

courseware had been developed as a result of the project (Table 13) (Appendix C). Information on the developed products was most often available only through the project director, or individual software developer; however, one courseware package was available commercially through an educational materials agency. The next most frequently described products were software evaluation and inservice/preservice workshops or courses.

#### RELATIONSHIP OF NEEDS TO PROJECTS CONDUCTED

#### Research Projects

In general, the directions of research projects identified were consistent with needs identified by professionals. There were areas, however, where many respondents indicated an area as a research need, yet a limited number of projects were identified.

The greatest concentration of research activity was in the area of developing inservice for home economics teachers. Other popular objectives were evaluating software and developing preservice training. Such research projects were reflective of the immediate need to train teachers to use computers and to provide materials for their use.

While software evaluation and inservice/preservice education were identified as research needs, the needs identified by the largest number of respondents related to two concept areas: computers and learning, and instructional software. In particular, the subconcept identified by the most respondents was the need for a comparison of the effectiveness of instructional methods. From a review of the projects reported, only three studied the effectiveness of the computer as an instructional medium; no studies were identified which compared the computer with other instructional media.

The need for software development guidelines was also recognized by a large number of respondents. While guidelines may be outcomes of projects designed to develop or evaluate software, no such guidelines were identified as outcomes of the projects reported. As further research projects are developed, including studies comparing the effectiveness of the computer with other instructional methods, such guidelines are needed. The development and publication of guidelines is needed to provide a basis for the development of a greater number of quality software programs in home economics education.

Other research needs identified by a large number of respondents included an analysis of current use of computers and software in home economics education, and the identification of guidelines for implementing computers in the home economics curriculum. At the time of the study, few studies analyzed current use; no research studies were identified which provided guidelines for using computers in home economics instruction. This may be reflective of the infant nature of the phenomenon at the time of the study. As more home economics programs integrate computer applications, it becomes increasingly important to identify and analyze characteristics of model programs. Such data in combination with other research can serve as a basis for the development of guidelines for integrating computers in home economics.

Many respondents also identified the need for research to analyze the impact of computers on individuals and families. Only two studies were reported which focused specifically on homemakers. One dealt with use of the computer as an individualized instruction medium to teach nutrition concepts to rural homemakers. The other used a case study approach to examine the effects of the microcomputer on family relationships within the home. While it is recognized that other professions are involved in the analysis of the computer's effect on the home, home economics educators can and should provide leadership in this area.

#### Exemplary Projects

The exemplary projects described appeared to be progressing toward stated needs for such programs. When projects appeared to have multiple purposes, integrating technology into the home economics curriculum was a popular goal. Often the same respondents who described exemplary projects involving curriculum development were those who stressed the need to continue in this. direction.

Evaluation of existing software was the most often described purpose of the exemplary projects. Criteria were developed in the evaluation process; the results of evaluation were shared with project participants and in some cases with other home economics educators. However, only one project included a reproducable document resulting from the project. It is possible that stated project needs for the comparison of effectiveness of instructional methods, learning theories, and with special groups were included in software evaluation criteria of several projects; or, the continued need to address these concerns may indicate that at present the field has not yet progressed to the point of evaluating more critically the software available.

Software developme t was a purpose of many projects. Just less than half identified some software product resulting from the project. For the most part, these products were not yet available to other home economics educators. The "under-development" status of several projects, and the descriptions of "short programs", "refinement of earlier work", and "adapting programs for use in the classroom" led the researchers to conclude that many efforts were still in the seminal stages.

The distinction made between "software" and "courseware" often found in the literature might well apply to the examination of these exemplary project products. The finding that more projects included software development than projects identifying software development as a major purpose, and that some respondents were reluctant to classify their own efforts as "model programs" although their peers did identify them as such, supports the belief that home economics educators were quickly gaining the skills necessary to utilize computer technology in the classroom.

However, a compendium of suitable courseware products from which to select is not yet available.

When funding information was included in project descriptions, the amounts were very limited (under \$5000). Funds were often used to purchase hardware and software, to provide stipends for workshop participants, or extended pay for workshop leaders. Little evidence was included to suggest that computer programmers or educational software developers were hired to facilitate software development. The inservice emphasis of the projects, and goal of computer literacy (including programming skills) for the project audience may provide some explanation for the apparent hesitancy to make the software products available on a large scale.

Finally, it appeared that a recognition of the need to develop networks of computer-using home economics educators was beginning to be realized. Comments that software lending libraries were established or recommended, that public-domain software was shared, and that individual software developers were willing to informally share their work with others all supported the desire for network development. Although only two projects specifically included network development, perhaps it was an underlying motivation of several project directors and workshop participants to expand their contacts with other computer-using home economics educators.

#### CONCLUSIONS AND RECOMMENDATIONS

In conclusion, the field of home economics education is moving quickly toward addressing and maximizing the potential impact of computers. Considerable activity has been initiated in the field through both research and exemplary project efforts.

Initial research and exemplary project efforts at the time of the survey have concentrated primarily on inservice for home economics teachers. Other areas in which considerable activity has been initiated included the development and evaluation of secondary level software applications. These emphases on teacher inservice and software development/evaluation were concluded to be natural outcomes of the immediate concern that home economics teachers and programs are involved in the technology explosion.

Further needs for research and exemplary projects must be addressed in order for the field to realize the full potential of the computer in home economics education. As a result of this national survey of research and exemplary projects in home economics education, five needs have been identified. The first three needs relate to content directions for research and exemplary projects. The last two needs relate to organization and administration of projects.

First, the computer's effectiveness as an instructional medium in comparison with other forms of media needs to be addressed. No studies in home economics education were identified which focused on this area. Without a sufficient base to analyze instructional effectiveness, computers may be used to teach home economics content simply because the computer is currently a popular learning tool. The long term implication is that the computer may become less popular with students because it is not used in its most effective sense. In addition to developing research in the field, home economics educators can draw upon research findings on computer effectiveness from other fields, such as education.

A second need is to develop home economics curriculum integrating computer applications. There was some evidence to suggest that this was beginning to happen at the time of the survey. Home economics curriculum integrating computer applications would include an analysis of "high tech" as well as "high touch" applications. Specific directions for curriculum would include: using the computer as a learning tool, analyzing technological applications in the home, and analyzing the meaning of technology in personal and family life. Such a curriculum should identify applications to comprehensive consumer and homemaking education, as well as the development of specialized course(s) concentrating on technological applications to personal and family life. Possible approaches to addressing this need would include the identification and analysis of model programs.

Third, guidelines for software development in home economics

education need to be identified. Consistently, respondents identified concerns for quality software assurances. There is evidence to support that this need was beginning to be addressed. Preliminary efforts in many states included an analysis of software that was available. Software development guidelines would also need to be based on an understanding of the effectiveness of the computer as an instructional medium.

Fourth, individuals initiating projects in this area should consider focusing projects on one or two main objectives. A natural tendency in developing a project in a new area is to develop more objectives than often can be reasonably achieved considering available resources.

Fifth and finally, some organization and coordination of computer research and exemplary project activities in home economics education is needed. From a review of the projects conducted, several projects had similar objectives and, as a result, produced similar outcomes. Some duplication of effort is reflective of the infant nature of the area, and, of course, is necessary. Since in many cases funding was limited, the field could benefit by some organization and coordination of activity. This project is an initial effort to achieve that end.

#### THE UNIVERSITY OF NORTH DAKOTA

**DEPARTMENT OF HOME ECONOMICS & NUTRITION** 

Box 8273, University Station Grand Forks, North Dakota 58202 (701) 777-2539

February 22, 1984

TO: Teacher Éducators and State Supervisors Vocational Home Economics Education

The AVA Home Economics Division Standing Research Committee has formed a Sub-committee on Computer Research in Home Economics Education. One of the first tasks of this subcommittee is to assess the "state of the art" of research and exemplary projects related to computers in home economics education. This assessment will provide a basis for facilitating communication and for stimulating further research and creative efforts in the field.

Please complete the enclosed "National Survey on Computer Research and Exemplary P jects in Home Economics Education" by March 15. If you know a colleague who has oeen directly involved, feel free to forward a copy of the survey to her/him to complete. If you have not had a research or exemplary project, complete only page I and return. In accordance with human subjects guidelines, filling out the questionnaire implies consent to participate in the survey.

This study is being supported in part by the U.S. Department of Education through the Vocational Home Economics Education annual program of work. If you have questions or comments about the survey, please contact either of us or subcommittee members Cheryl Hausafus, Iowa State University (515-294-5307) or Daun Anderson, the Pennsylvania State University (814-863-3860).

We look forward to hearing from you.

Sincerely,

Glinda B. Crawford

Subcommittee Chalrwoman Home Economics and Nutrition University of North Dakota

	Phone	
	I would like a copy of the project report.	CODE
I.	Describe your perception of research needs related to computers and home economics education.  Describe your perception of exemplary project needs relative to computers and home economics education. (Not listed above)	(6)
III.	Are you aware of model secondary, postsecondary, or adult programs in which home economics educators are teaching a course or courses on computer applications to individuals and/or families.  Check: (22) No (0)	Yes (1)
	If Yes, list the following information for up to three:     Educator's name     Position     Address     Phone     Brief description	

IV. This section requests information on projects related to computers in home economics education. This would include:

Projects in homemaking or occupational home economics education.

Projects in Comprehensive Consumer & Homemaking Education or in Specialized areas(e.g. nutrition, child development)

Projects completed, in progress, or planned.

If you are reporting on more than one project, please make additional copies of pages 2 and 3 to complete. In addition, if you know a colleague who should report on a computer project because of its implications for home economics education, please duplicate these pages for her/him to complete and return.
